

How to generate a SMILES for an abbreviation?

- Draw the substructure/protective group you want to abbreviate as normal in ChemDraw; for example the p-Methoxybenzyl (PMB) protective group:

- Add an 'any atom' at the position where the protective group will be connected to the main structure:

- Select the protective group:

- Click on "Edit" → "Copy As" → "SMILES"
This will add the SMILES to the clipboard and it can be pasted via "Ctrl + V" or right mouse button → "Paste": COC1=CC=C(CO[*])C=C1
- The SMILES can then be added to the abbreviations list, together with its abbreviation:
PMB COC1=CC=C(CO[*])C=C1
